

Application for solar controllers **SOLAR**

This application SOLAR allows effectively use with controllers DUEL for solar thermal systems. Through the application can monitor the current temperature in the system, status of actuators, required parameters etc., directly on your PC screen and gain an overview of the whole controlled facility. If necessary, you can change the setting of the controller and achieve the desired new values in the system.

- Temperature control in individual control circuits, according to the selected program
- Monitoring of energy consumed in each circuit
- Possibility of manual modification of the controlled system
- Equithermic regulation
- Antifreeze protection
- Connection to the PC and Internet with statistical processing of data
- Modular system, mounting on 35 mm DIN rail
- Creating a standard weekly programs for reg. rooms
- Graphics and color support when setting data
